                                                           This sequence represents a fragment of the human connective tissue growth factor (TGCF) Polypeptide which has mitogenic activity. The growth factor (TGCF) Polypeptide which has mitogenic activity. The sequence covers the amino acids encoded by exons 4 and 5 of the full sequence covers the amino acids encoded by exons 4 and 5 of the full length cDNA sequence (AAA11280). The protein can be used to raise antibodies which specifically bind to CTGF and are used to treat a antibodies which specifically bind to CTGF and are used to treat a cTGF associated dispase of disorder, e.g. a fibroproliferative fibrosis, such as kidney fibrosis, scleroderm, pulmonary fibrosis, liver fibrosis, arthritis, hypertropic scarring, atherosclerosis, atheritis, hypertropic scarring, kidney disorders, andiogenesis-related disorders, skin fibrotic disorders, and cardiovascular disorders. The protein is also useful in wound healing, bone and tissue repair.
                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Connective tissue growth factor (CTGF) (AAW12694) is a cysteine-rich mitogenic protein which is selectively induced in fibroblasts after activation with transforming growth factor beta (TGF-beta).

Recombinant CTGF can be produced in prokaryotic or eukaryotic host secombinant CTGF can isolated CTGF gene (AAT59618). Compsis.

cells utilising an isolated CTGF gene (AAT59618). Compsis.

induce bonding formation, e.g. to treat osteoporosis, induce bonding formation, e.g. to traduce tissue and cartilage osteoarthritis and osteochondrytis, to induce tissue and cartilage culture systems e.g. to expand stem cells or chondrocytes prior to culture systems e.g. to expand stem cells or chondrocytes prior to re-implantation. CTGF is more stable to protease degradation than other growth factors used as prior art wound healing agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New connective tissue growth factor - used to develop prods. for

                                               Novel human connective tissue growth factor (CTGF) (AAR79964) is related immunologically and biologically to platelet-derived growth factor (PDGF), but is the product of a distinct gene.

GTGF is mitogenic and ano a chemotactic agent for cells. It is produced by endothelial and fibroblastic cells, and probably acts as a growth factor in wound healing. Recombinant CTGF can be obtd. by expression of CDNA clone DBG0R32 (AAT04226) in transformed host cells. It is used to accelerate wound healing, and to raise antibodies useful in detecting disorders associated with overgrowth of cells, such as cancer, fibrotic diseases and atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Connective tissue growth factor; CTGF; mitogen; cell proliferation; wound healing; cancer; tumour; fibrosis; glaucoma; atherosclerosis; scleroderma; arthritis, cirrhosis; scar; diagnosis; therapy.

                                                                                                                                                                                                                                                       Novel human connective tissue growth factor (CTGF) (AAW09089) is a PDGF-immunorelated protein that may play a significant role in the normal development, growth and repair of human tissue and probably functions as a growth factor in wound healing. CTGF may be involved in diseases in which there is an overgrowth of connective tissue cells, such as cancer, tumour formation and growth, fibrotic diseases (e.g. pulmonary fibrosis, kidney fibrosis, glaucoma) and atherosclerosis. Recombinant CTGF can be produced in transformed host cells utilising a cDWA clone isolated from a HUVEC library. It can be used to accelerate wound healing. CTGF inhibitors can be used to treat atherosclerosis and fibrotic diseases such as scleroderma, arthritis, liver cirrhosis, and scarring.

A method has been developed for ameliorating a cell proliferative disorder associated with connective tissue growth factor (CTGF). The method comprises the administration of an antibody or its fragment that binds to CTGF and not to platelet derived growth factor (PDGF), to the bits of the disorder. CTGF is related immunologically and biologically site of the disorder. GTGF is related immunologically and biologically to PDGF. The present sequence represents CTGF. The method is used to treat conditions involving the overgrowth of connective tissue cells such as cancer, atherosclerosis and other fibrotic diseases.
                                                                                         Ameliorating cell proliferative disorder associated with connective tissue growth factor - comprises the administration of an antibody which binds to connective tissue growth factor and not to platelet-derived growth factor

                                                                                                                                                                                                                                                                                                                             à
                                                                                                                                                                                                   ö
                                                                                This sequence is the human connective tissue growth factor (CTGF). The invention relates to a method of detecting a cell proliferative disorder comprising comparing the level of CTGF in a sample against a control, where an increase is indicative of a cell proliferative disorder (fibrotic disease or atherosclerosis). The method is used to detect cell proliferative disorders such as fibrotic disease and atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                           CTGF; connective tissue growth factor; bone formation; tissue; arthritis; wound healing; cartilage formation; osteoporosis; osteoarthritis; burn; osteochondrytis; skeletal disorder; hypertrophic scar; protease; poGF; degradation; vascular hypertrophy; platelet derived growth factor.

```
This represents the amino acid sequence of connective tissue growth factor (CTGF). This can be used in the method of the invention for inducing bone or tissue formation that comprises administration to a patient, a composition comprising CTGF and a carrier. CTGF can also be used in a method for inducing wound healing. The methods can be used for inducing bone, tissue or cartilage formation in disorders such as osteoporosis, osteoarthritis or osteochondrytis, arthritis, skeletal disorders, hypertrophic scars, burns, vascular hypertrophy, or in wound healing. The CTGF and functional fragments are more stable and less susceptible to protease degradation than platelet derived growth factor (PDGF) and other growth factors known to be involved in wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180 aayrledtfgpdptmiranclvgttewsacsktcgmgistrvtndnascrlekgsrlcmv 239

The invention collagen synthesis and/or myofibroblast differentiation. The invention collagen synthesis and/or myofibroblast differentiation. The invention of cross and synthesis and/or myofibroblast differentiation. The invention of collagens to fragments of cross and collagens and the coding sequence can be used to can be used to raise antibodies and the coding sequence can be used to can be used to can be used to against the CTGF sequence can be used in a method to treat a gainst the CTGF sequence can be used in a method to treat a capainst the cross sequence can be used in a method to treat a capainst the cross sequence can be used in a method to treat a sequence can be used in a method to treat a capacidated disease or disorder such as a fibropial scarring, or disorder specially selected from kidney fibrosis, scleroderma, or disorders, andiogenesis, arthritis, hypertropic scarring, canherosclerosis, diabetic nephropathy and retropicates, skin fibrotic can disorders, and fibrosis of crosses or disorders and cardiovascular disorders. The disease or disorder can adiation therapy, and fibrosis of organs), diseases caused by vascular cadiation therapy and fibrosis of organs), diseases caused by vascular candation therapy and fibrosis of organs), diseases caused by vascular candation therapy or migration (including cancers), endothelial call proliferation or migration (including cancers), inflammatory bowel disease, crohn's diseases, diabetes, and keloids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; connective tissue growth factor; CTGF; mitogen; antibody; liver;

                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a human connective tissue growth factor (CTGF) polypeptide which has mitogenic activity. The protein can be used to raise antibodies which specifically bind to cryff and are used to treat a crgF-associated disease or disorder, e.g. a fibroproliferative disease, disorder, and a fibroproliferative fibrosis, liver fibrosis, arthritis, hypertropic scarring, atheroscierosis, diabetic nephropathy and retinopathy, hypertension, kidney disorders, and cardiovascular disorders. The protein is also useful in wound healing, bone and tissue repair.

                                                                                                                                                                          The present sequence is human connective tissue growth factor, which is a member of CCN growth regulator family It has antianglogenic activity and is a potent inhibitor of basic fibroblast growth factor (bFGF) stimulated bovine endothelial cell proliferation. It contains Insular-like growth factor (IGF)-binding domain, von Willebrand factor type C repeat, Thrombospondin type I domain and C-terminal systeine knot profile (CTCK)-2 domain. It can be used to treat conditions associated with abnormal angiogenesis or neovascularisation like, retinal neovascularisation, tumnour growth, haemangloma, solid tumnours, leukaemia, metastasis, psoriasis, neovascular glaucoma, diabetic retinopathy, arthritis, endometriosis and premature retinopathy.

The invention relates to a method for the recombinant production of human connective tissue growth factor (CTGF; AAB60664), involving transforming a prokaryotic or eukaryotic host cell with an expression construct comprising the CTGF CDNA squence (AAF5954) or a fragment thereof, and culturing the host cell under conditions suitable for the expression of CTGF. CTGF is a mitogen and chemctactic agent for connective tissue cells and plays a significant role in normal development, growth and repair of human tissues. It is useful as a therapeutic for accelerating wound healing and promoting normal healing mechanisms and may therefore be used in the treatment of 6 e.g., burns. CTGF is also useful as a diagnostic reagent for diagnosing pathological states in a patient suspected of having a disease characterised by a busing an expense of cellular proliferation. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                             Producing connective tissue growth factor involves transforming a host cell with polynucleotide encoding the growth factor and growing the cell under optimum conditions so that the polynucleotide is expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 RPCEADLEENIKKGKKCIRTPKISKPIKFELSGCTSMKTYRAKFCGVCTDGRCCTPHRTT 120

The invention relates to methods of accelerating wound healing in a patient. One method involves contacting the site of the wound with a composition comprising purified connective tissue growth factor composition comprising prowin factor beta (TGF-beta). Which (TGF AAB4881) and transforming growth factor beta (TGF-beta), which catinates the production of CTGF in vivo. Another method involves stimulating the growth of connective tissue cells by contacting the growth of connective tissue cells by contacting the catinating the growth of an active fragment thereof. CTGF is produced by cells with CTGF or an active fragment thereof. CTGF is produced by cells. It has biologically similar activity to PDGF (platelet-derived cells. It has biologically similar activity to PDGF (platelet-derived the product of a distinct gene. CTGF is useful for accelerating wound the product of a distinct gene. CTGF is useful for accelerating wound the growth of connective tissue cells. CTGF, or is functional fragments, is more stable and less susceptible to its involved in wound healing. The present sequence represents human CTGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 RPCEADLEENIKKGKKCIRTPKISKPIKFELSGCTSMKTYRAKFCGVCTDGRCCTPHRTT 120

connective tissue growth factor (GTGF). AAY24369 to AAY24378 represent connective tissue growth factor (GTGF). AAY24369 to AAY24378 represent these monoclonal antibodies. The antibodies are useful in the diagnosis, prevention and treatment of cell proliferation disorders in which GTGF is implicated, including fibrosis of lung, kidney, liver and other tissues; liver cirrhosis; nephritis; skin ulcers and keloid; rheumatoid arthritis; rheumatic vascular inflammation; hepatitis; and cancer. The present sequence represents rat GTGF.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-1 TISSUE SPECIFICITY: TESTIS, SPLEEN, KIDNEY, LUNG, HEART, AND BRAIN (LOWEST LEVEL IN TESTIS AND HIGHEST IN LUNG).

-1 INDUCTION: BY GROWTH FACTORS.

-1 SIMILARITY: BELONGS TO THE INSULIN-LIKE GROWTH FACTOR BINDING PROTEIN FAMILY. CEF-10/CYR61/CTFG/FISP-12/NOV PROTEIN SUBFAMILY.

-1 SIMILARITY: CONTAINS 1 VWFC DOMAIN.

-1 SIMILARITY: CONTAINS 1 C-TERMINAL CYSTINE KNOT-LIKE DOMAIN (CTCK).

-i- INDUCTION: BY GROWTH FACTORS.
-i- SIMILARITY: BELONGS TO THE INSULIN-LIKE GROWTH FACTOR BINDING PROTEIN FAMILY. CEF-10/CXR61/CTFG/FISP-12/NOV PROTEIN SUBFAMILY.
-i- SIMILARITY: CONTAINS 1 VWFC DOMAIN.
-i- SIMILARITY: CONTAINS 1 C-TERMINAL CYSTINE KNOT-LIKE DOMAIN (CTCK).
